# RB-600 AH 2 – Wire mesh belt continous shot-blasting machine

### Application

The RB-600 AH 2 wire mesh shot-blasting machine is mainly suitable for the low investment cost de-rusting, de-scaling and cleaning of

- Small castings made of aluminium or steel
- Small forged parts made of aluminium or steel
- All smaller parts that cannot be bulk blasted
- Marble and granite rocks and bricks for decoration purposes

#### Description

The machine is equipped with 2 pieces of ABR  $_380$  type blasting turbines. These turbines are situated above the wire mesh conveyor top level to ensure the possible best covering of the top surface of through-pass cross section. Blasting is done in an angle of  $_{70}^{\circ}$  to the direction of proceeding to reach lengthened covering.

The turbines are gravity fed with abrasive material, they have eight blasting blades and a pre-accelerator and they allow precise blasting direction adjustment.

The inner surfaces of the machine in the active zone are covered with highly wearresistant manganese steel, other inner parts are protected by wear-resistant rubber sheet. This rubber cover has noise-reducing effect as well. wires in the machine house are made of highly wear resistant spring steel to provide suitable lifetime for the conveyor.

The three-layer rubber curtains at the inlet and outlet sluice prevent the high velocity abrasive particles from shooting out.

Blasting pattern

Due to the zblasting turbines on the top this machine provides fast cleaning speed for this cross section on one side.

The closed and continuous circulation of the shot-blasting media is ensured by a screw conveyor, bucket elevator, abrasive cleaning air classifier unit and a feeding unit. In foundries an additional magnetic drum separator is built in the machine to separate forming sand from the circulation.

The clean work-piece is de-dusted by a high pressure blow-off fan built on the exit section of the machine with adjustable height.

The dust-aspirating and separating system of the equipment consists of galvanized steel airducts, form-elements, aspiration fan and filter cartridge inserted dust-separator.

Dust emission after the filter is not more than 3mg/m3.

All functions of the machine can be controlled from the central control box. Besides the normal mode of operation (automatic mode) manual mode is also available for maintenance purposes.
